Engineering students can take advantage of code at every single lecture

Engineering students can take advantage of code at every single lecture

Papert (1980) “...the best learning takes place when the learner takes charge”

- An example problem is solved by the professor provided code

Engineering students can take advantage of code at every single lecture

Papert (1980) “...the best learning takes place when the learner takes charge”

- An example problem is solved by the professor provided code
- The student **recycles** it to solve other related problems

Engineering students can take advantage of code at every single lecture

Papert (1980) “...the best learning takes place when the learner takes charge”

- An example problem is solved by the professor provided code
- The student **recycles** it to solve other related problems
- Gradually becoming autonomous by reusing not the provided but his own code

Tools — Jupyter notebook: text + equations + executable code

The screenshot shows a Jupyter Notebook window with the title "PÉNDULO ENHEBRADO SOLVED.IPYNB". The left sidebar contains a table of contents with the following items:

- Péndulo enhebrado en aro
- Enunciado
- 1. Construya el Lagrangiano y la(s) función(es) de ligadura
- 2. Calcule las ecuaciones de Euler-Lagrange
- 3. Obtenga una expresión para la tensión que ejerce la barra
- 4. Grafique la tensión en los primeros diez segundos de la dinámica.

The main content area displays the following text and code:

3. Obtenga una expresión para la tensión que ejerce la barra

$$Q_d = \lambda_1 \frac{\partial f_1}{\partial d} = \lambda_1$$

Por tanto hay que resolver el sistema con las 3 ecuaciones de Euler-Lagrange y la única de ligadura para determinar λ_1 . Esta última hay que resolverla para su caso homogéneo y expresar su derivada segunda para que esté en el mismo orden que las de Euler-Lagrange, a fin de cuentas estamos resolviendo sistemas diferenciales de 2.º orden.

```
[14]: f_1
```

$$f_1 = -l + d$$

Determinamos también $\ddot{\theta}_1$ y $\ddot{\theta}_2$ pues serán necesarias para los cálculos numéricos posteriores.

```
[15]: sistema = [theta1_EL.expand(),
               theta2_EL.expand(),
               d_EL.expand(),
               sym.Eq(f_1.rhs.diff(t,2), 0), # esto es igual a d punto punto = 0
               ]
variables = [theta1.diff(t,2), theta2.diff(t,2), lambda_1]
variables_sol = sym.nonlinsolve(sistema, variables).args[0]
```

```
[16]: lambda_1_sol = sym.Eq(lambda_1, variables_sol.args[2])
      lambda_1_sol.simplify()
```

```
[16]:
```

$$\lambda_1 = \frac{m \left(2a \cos(\theta_1 - \theta_2) \dot{\theta}_1^2 + g \cos(2\theta_1 - \theta_2) + g \cos(\theta_2) + 2d\ddot{\theta}_2 - 2\ddot{d} \right)}{\cos(2\theta_1 - 2\theta_2) - 3}$$

Tools — Google Colaboratory runs Jupyter notebooks on-line

- The platform allows professors to edit and comment on the work of students.
- Students can collaborate remotely, working on the same Jupyter notebook.

The screenshot displays a Google Colaboratory Jupyter notebook. The top bar includes the Google Colab logo, the notebook title "07 No conservativas | ej4", and navigation links like "Archivo", "Editar", "Ver", "Insertar", "Entorno de ejecución", "Herramientas", and "Ayuda". On the right, there are buttons for "Comentar", "Compartir", and a user profile icon.

The notebook content is divided into two main sections. The first section, titled "+ Código", contains a Jupyter code cell with Python code using SymPy for symbolic computation. The code defines variables for a physics problem involving a spring and a pendulum, calculates potential energy components, and combines them into a total potential energy V .

$$V = gm_1(-l_{10} - x_1)\sin(\theta) + \frac{k_1(l_{10} + x_1)^2}{2} + \frac{k_2(l_{20} + x)^2}{2}$$

The second section, titled "Lagrangiano", contains another code cell defining the Lagrangian L as the difference between kinetic energy T and potential energy V .

$$L = -gm_1(-l_{10} - x_1)\sin(\theta) - \frac{k_1(l_{10} + x_1)^2}{2} - \frac{k_2(l_{20} + x)^2}{2} + \frac{(m_0 + m_1)(2\cos(\theta)\dot{x}\dot{x}_1 + \dot{x}^2 + \dot{x}_1^2)}{2}$$

Below the code cells, the text "ECUACIONES DE EULER" is visible. At the bottom left, there is a "Para x" label. On the right side of the notebook, there is a comment thread. The first comment is from Victor Alexis Bettachini, dated May 31, 2021, discussing the physical interpretation of the spring constants k_1 and k_2 .

Victor Alexis Bettachini Resolver
31 de may. de 2021
(editado el 31 de may. de 2021)

- El estiramiento del resorte de k_1 es colineal con x_1 . No tienen sentido pensar en proyecciones (si es lo que hiciste, que realmente no entiendo).
- ¿Porque negativos los k ?

At the bottom right, there is another comment from the same user.

Victor Alexis Bettachini Resolver

Tools — All course material in a GitHub repository

- Clearly organised, freely accessible, and easy to update.
- Google Colaboratory loads Jupyter notebooks directly from GitHub.

The screenshot shows the GitHub repository page for 'MecanicaAnaliticaComputacional' by user 'bettachini'. The repository is public and has 3 stars, 2 forks, and 3 watchers. It is currently on the 'master' branch with 2 branches in total. A notification states 'Your master branch isn't protected'. The repository contains a list of files and folders, including '00Generalidades', '01Vectorial', '03Energía', '04EulerLagrange', '05Ligaduras', '06Simulación', '07FuerzasLigadura', '08NoConservativas', '09aNoInercial', and '09bTensorInercia'. The 'About' section describes it as a repository for the 'Mecánica Analítica Computacional' course. The 'Releases' section shows the latest release 'v2023p' from August 10.

Releases: v2023p (Latest) on Aug 10

Tools — From the 1st class — L^AT_EX: concise mathematical notation

- L^AT_EX typesetting follows strictly the standards of the American Mathematical Society

Considero que el potencial V es nulo en el origen de coordenadas, es decir que donde se encuentra su mínimo $\varphi = 0$, $V(\varphi = 0) = -mg\ell$ y por tanto

$$V(\varphi) = mg(-\ell \cos \varphi) = -mg\ell \cos \varphi,$$

Como vemos la aproximación funciona bastante bien. Conformes con ella calculamos la fuerza

$$\vec{F} = -\vec{\nabla}V = -\left(\frac{\partial}{\partial r}, \frac{1}{r}\frac{\partial}{\partial \varphi}, \frac{\partial}{\partial z}\right)V(\varphi)$$

Pero solo nos interesa expresar la 2.a ley de Newton para lo que pasa en $\hat{\varphi}$

$$m\ddot{\vec{r}} \cdot \hat{\varphi} = -\frac{1}{r}\frac{\partial}{\partial \varphi}V(\varphi)$$

En el lado izquierdo de la expresión de la aceleración en cilíndricas $\ddot{\vec{r}} = (\ddot{r} - r\dot{\varphi}^2)\hat{r} + (r\dot{\varphi}^2 + r\ddot{\varphi})\hat{\varphi} + \ddot{z}\hat{z}$, nos quedamos solo con la componente en $\hat{\varphi}$,

$$\ddot{\vec{r}} \cdot \hat{\varphi} = r\dot{\varphi}^2 + r\ddot{\varphi}$$

y como el hilo del péndulo es rígido e inextensible $r \equiv \ell$ solo queda de esto

$$\ddot{\vec{r}} \cdot \hat{\varphi} = \ell \ddot{\varphi}$$

En el lado derecho la derivada del potencial respecto a φ es

$$\frac{\partial}{\partial \varphi}V(\varphi) = mg\ell \sin(\varphi)$$

Tools — 1st class — Matplotlib: precise and reproducible graphics

- Explicit Python code for producing graphics. Students are enticed to play with it.

```
# graficación
fig, ax = plt.subplots(figsize=(12, 4))
ax.plot(tiempos, phi(tiempos), 'o-')
ax.set_xlabel('Tiempo [s]')
ax.set_ylabel(r'$\varphi$ [rad]')
```

```
Text(0, 0.5, '$\varphi$ [rad]')
```

Tools — 3rd class — SymPy: symbolic calculations

- Student's effort centred on new subjects by freeing them of calculus and algebraic tasks.

```
[8]: m2_v_cuadrado = m2_v.dot(m2_v)
     m2_v_cuadrado
```

$$[8]: \ell^2 \sin^2(\varphi) \dot{\varphi}^2 + (\ell \cos(\varphi) \dot{\varphi} + \dot{x})^2$$

Con esto la energía cinética queda

$$\begin{aligned} T(\dot{x}_1, \varphi, \dot{\varphi}) &= \frac{m_1}{2} (\dot{r}_1)^2 + \frac{m_2}{2} (\dot{r}_2)^2 \\ &= \frac{m_1}{2} \dot{x}^2 + \frac{m_2}{2} (\dot{x}^2 + 2\dot{x}\ell \cos \varphi \dot{\varphi} + \ell^2 \dot{\varphi}^2) \end{aligned}$$

```
[9]: # Energía cinética
unMedio = sym.Rational(1,2) # Rational: fracción de enteros, alternatively podría haberse usado 0.5
m1_T = unMedio*m1*m1_v_cuadrado
m2_T = unMedio*m2*m2_v_cuadrado
T = sym.Eq(sym.Symbol('T'), (m1_T + m2_T)) # simplify: simplifica usando factor común y otras operaciones
T
```

$$[9]: T = \frac{m_1 \dot{x}^2}{2} + \frac{m_2 (\ell^2 \sin^2(\varphi) \dot{\varphi}^2 + (\ell \cos(\varphi) \dot{\varphi} + \dot{x})^2)}{2}$$

Tools — 4th class — Equations for Lagrangian dynamics

Ecuaciones de Euler-Lagrange

Para x

```
[8]: x_EL = sym.Eq(L.rhs.diff(x) - L.rhs.diff(x.diff(t)).diff(t), 0).simplify() # ecuación igualando a cero  
x_EL
```

$$[8]: m_1 \ddot{x} + m_2 \left(-\ell \sin(\phi) \dot{\phi}^2 + \ell \cos(\phi) \ddot{\phi} + \ddot{x} \right) = 0$$

Esta es una ecuación diferencial lineal de segundo orden homogénea. De aquí podría despejarse \ddot{x}

```
[9]: sym.Eq(x.diff(t,2),  
          list( sym.solve(x_EL, x.diff(t,2) ) ) [0] # solveset devuelve un set, que convertimos a lista  
          ) # aceleración = x punto punto [m s-2]
```

$$[9]: \ddot{x} = \frac{\ell m_2 \left(\sin(\phi) \dot{\phi}^2 - \cos(\phi) \ddot{\phi} \right)}{m_1 + m_2}$$

Pero queda en función de otra aceleración $\ddot{\phi}$.

Para ϕ

```
[10]: phi_EL = sym.Eq(L.rhs.diff(phi) - L.rhs.diff(phi.diff(t)).diff(t), 0).simplify() # ecuación igualando a cero  
phi_EL
```

Tools — 4th class — Automatisation of resolutions

- Mathematical complexity doesn't limit the scope of tackled mechanical problems.

```
[14]: sistemaEcuaciones = [  
    x_EL,  
    phi_EL,  
]  
variablesDespeje = [x.diff(t,2), phi.diff(t,2)] # despejar aceleraciones generalizadas  
variablesDespeje_sol = sym.nonlinsolve(sistemaEcuaciones, variablesDespeje ).args[0]
```

```
[15]: x_pp = sym.Eq(variablesDespeje[0], variablesDespeje_sol.args[0] ) # [m s-2]  
phi_pp = sym.Eq(variablesDespeje[1], variablesDespeje_sol.args[1] ) # [m s-2]  
x_pp, phi_pp
```

$$[15]: \left(\ddot{x} = \frac{-\ell g m_2 \sin(\phi) + \frac{\ell m_2 (\ell m_2 \cos(\phi) \dot{\phi}^2 + g m_1 + g m_2) \sin(\phi)}{m_1 + m_2 \sin^2(\phi)}}{\ell m_2 \cos(\phi)}, \ddot{\phi} = -\frac{(\ell m_2 \cos(\phi) \dot{\phi}^2 + g m_1 + g m_2) \sin(\phi)}{\ell (m_1 + m_2 \sin^2(\phi))} \right)$$

Tools — 5th class — SciPy: numerical computation of results

```
[22]: # defino una función con el sistema de derivadas
# t : no se usa en este sistema pero lo dejamos para uso posterior
# y : lista de estado con [y[0], y[1], y[2], y[3]]
# y[0]: x
# y[1]: x punto
# y[2]: phi
# y[3]: phi punto
# dydt : lista de derivadas
def y_punto(t, y):
    dydt = [y[1],
            x_pp_numpy(y[0], y[1], y[2], y[3]),
            y[3],
            phi_pp_numpy(y[0], y[1], y[2], y[3]),
            ]
    return dydt

[23]: # Integración de a pasos en el tiempo
y_ode2 = solve_ivp(y_punto, (t_rango[0], t_rango[-1]), y_inicial, t_eval = t_rango)

```

Tools — 5th class — Graphical analysis of numerical results

```
[26]: solucion = y_ode2
      nombreCoordenada = 'x'

      fig, ax = plt.subplots(nrows= 1, ncols= 2, squeeze=False, figsize=(12, 4)) # dos figuras en la misma fila
      fig.suptitle('Integración numérica para $'+ nombreCoordenada + '$', fontsize=16)
      ax[0,0].plot(solucion.t, solucion.y[0]) # posición x
      ax[0,0].set(xlabel='t [s]', ylabel='$' + nombreCoordenada + '$ [m]', title='Posición')
      ax[0,1].plot(solucion.t, solucion.y[1]) # velocidad x
      ax[0,1].set(xlabel='t [s]', ylabel='$\dot{x}$ [m/s]', title='Velocidad')
```

```
[26]: [Text(0.5, 0, 't [s]'),
      Text(0, 0.5, '$\dot{x}$ [m/s]'),
      Text(0.5, 1.0, 'Velocidad')]
```

Tools — 7th class — Adding complexity

- Code from previous classes is **recycled** to model more realistic devices.

Tools — 8th class — GitHub Copilot: AI assistance for coding

- Now that the students grasp the basics they're invited to take advantage of AI
- After commenting in plain text what they need code is suggested

```
lagrangiano = (T.rhs - V.rhs).expand()
t = sym.Symbol('t') # como se deriva respecto al tiempo con la función diff se declara t como símbolo
return sym.Eq(
    lagrangiano.diff(coordenadaGeneralizada)
    - lagrangiano.diff(coordenadaGeneralizada.diff(t)).diff(t)
    , 0
).simplify()
```

[21]

```
x1_EL = eulerLagrange(T, V, x1)
x1_EL
```

[22]

$$\dots \quad \frac{\pi^2 M \ddot{x}_1}{2} - gm_1 + gm_2 + m_1 \ddot{x}_1 + m_2 \ddot{x}_1 = 0$$

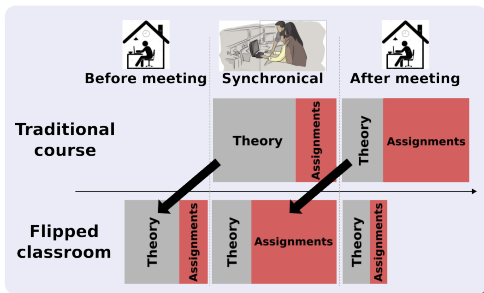

Esta es una ecuación diferencial lineal de segundo orden homogénea. De aquí se puede despejar \ddot{x}

▷ ▾

```
#Despejar x1PuntoPunto
x1PuntoPunto = sym.solve(x1_EL, x1.diff(t, t)).args[0]
```

- El estiramiento del resorte de k_1 es colineal con x_1 . No tienen sentido pensar en proyecciones (si es lo que hiciste, que realmente no entiendo).

- ¿Porque negativos los k ?

A code centred mechanics subject

2023-11-23

18 / 21

Thank You!

Summary

A course centred on code

- Material: text + equations + executable code in digital notebooks in a repository
- Assignments: professor's code recycling
- On-line:
 - ▶ Remote collaboration and correction
 - ▶ Doesn't require powerful nor at campus computers
 - ▶ AI assistance for coding
 - ▶ Dated record of each student's work

Flipped classroom

- Theory: emphasis on student's autonomous reading
- Reinforced by: suggested bibliography and short professor's videos
- Consultations: mostly on-line asynchronous and publicly accessible
- Synchronic meetings: TA's personal assistance for completing assignments
